Adobe's flagship app for professional image editing, Adobe Photoshop, marks a new era for Adobe. With the introduction of the brand new Photoshop mobile apps and Adobe XD, alongside a shift to new native graphic APIs, we are excited to announce that Photoshop will be moving to a more unified workflow across surfaces. Adobe's focus on the future is apparent in this latest version of the flagship desktop app. Users will now be able to edit images on their phone with the same advanced tools used for editing on their desktop. You can use the new Photoshop for iOS app to edit your photos and have them automatically transmitted to your desktop via Bluetooth and iCloud. In the desktop app, you can now select assets from your mobile phone library to edit, and now in addition

to long-pressing on the camera to add filters, you can also draw or type filters directly in-app.

The effects tool is the largest category of features in the Photoshop collection. You can add special effects to your photos, including 3D filters, color adjustments, lens corrections, light and perspective effects. See below for tips on how to apply these special effects. The Effects tool also contains a series of special effects tools. The Blur tool uses a brush to blur parts of an object. You can also blur the entire canvas if necessary. You'll control the strength of the blur from 0% to 100%. With a few techniques, you can control the blur effect to create a soft blur, a harder blur, or an extreme blur effect. The Composite Panel above the layers panel lets you create a composite of two or more layers. With the Join Layer option, you can also combine two layers into one composite. This lets you create a single layer of an object with a number of different elements. The command panel lets you take a snapshot and apply it to your entire canvas. The destination of the command can be set to None, which makes the command appear only once on the canvas. To apply the command, drag the snapshot over the canvas, and release the mouse button. The layer appears over the canvas. To make the command available to any future commands, use the swap icon in the lower left corner of the canvas and click OK. Also, if you use the Tidal brush, you can create the snapshot, use the command to apply it, and then swap the snapshot back out of the selection range, allowing you to apply a new snapshot to the same spot.
