We have been exploring these new native APIs for some time now, and are excited to get them into the product. They provide more direct access to the GPU, and allow us to build more powerful and efficient tools, even for real-time 3D. As we move to the new native APIs, we are deprecating the legacy OpenGL APIs in both Photoshop and Lightroom 4. The advantage of Photoshop is that it offers more than just an image editor. The first half is all about working with layers and the second half covers the more advanced features of Photoshop such as curves and gradients. The second half of Photoshop courses cover some of the more advanced features such as editing curves and gradients, text and filters and compositing. These features are important for Photoshop and are often tools that Photoshop pros use on a daily basis. Neat tools that have stood the test of time, such as Screen Capture, and Digital Eraser can be easily seen in the tutorials, but the most commonly used tools are discussed in the course up to a point. Since I've always studied Image Processing and Computer Graphics at college, I usually had to do all of my homework based on the tutorials (especially on the Photoshop and Illustrator functions) in the first half of my studies. A couple of weeks after I switched to the games industry, I decided to learn programming on my own, and then I worked on solving all of my homework before studying the actual topic. This was a very bad idea, because I got so scared by the amount of information that had to be learnt and my studies suffered. That was a long time ago! But I have had a great time at university and I think there are a lot of things to understand there. I can still start a topic in programming without any knowledge and finish it, but I can't do that with the math. I need to understand where he is coming from. I also think that everybody should be a bit computer nerd.
